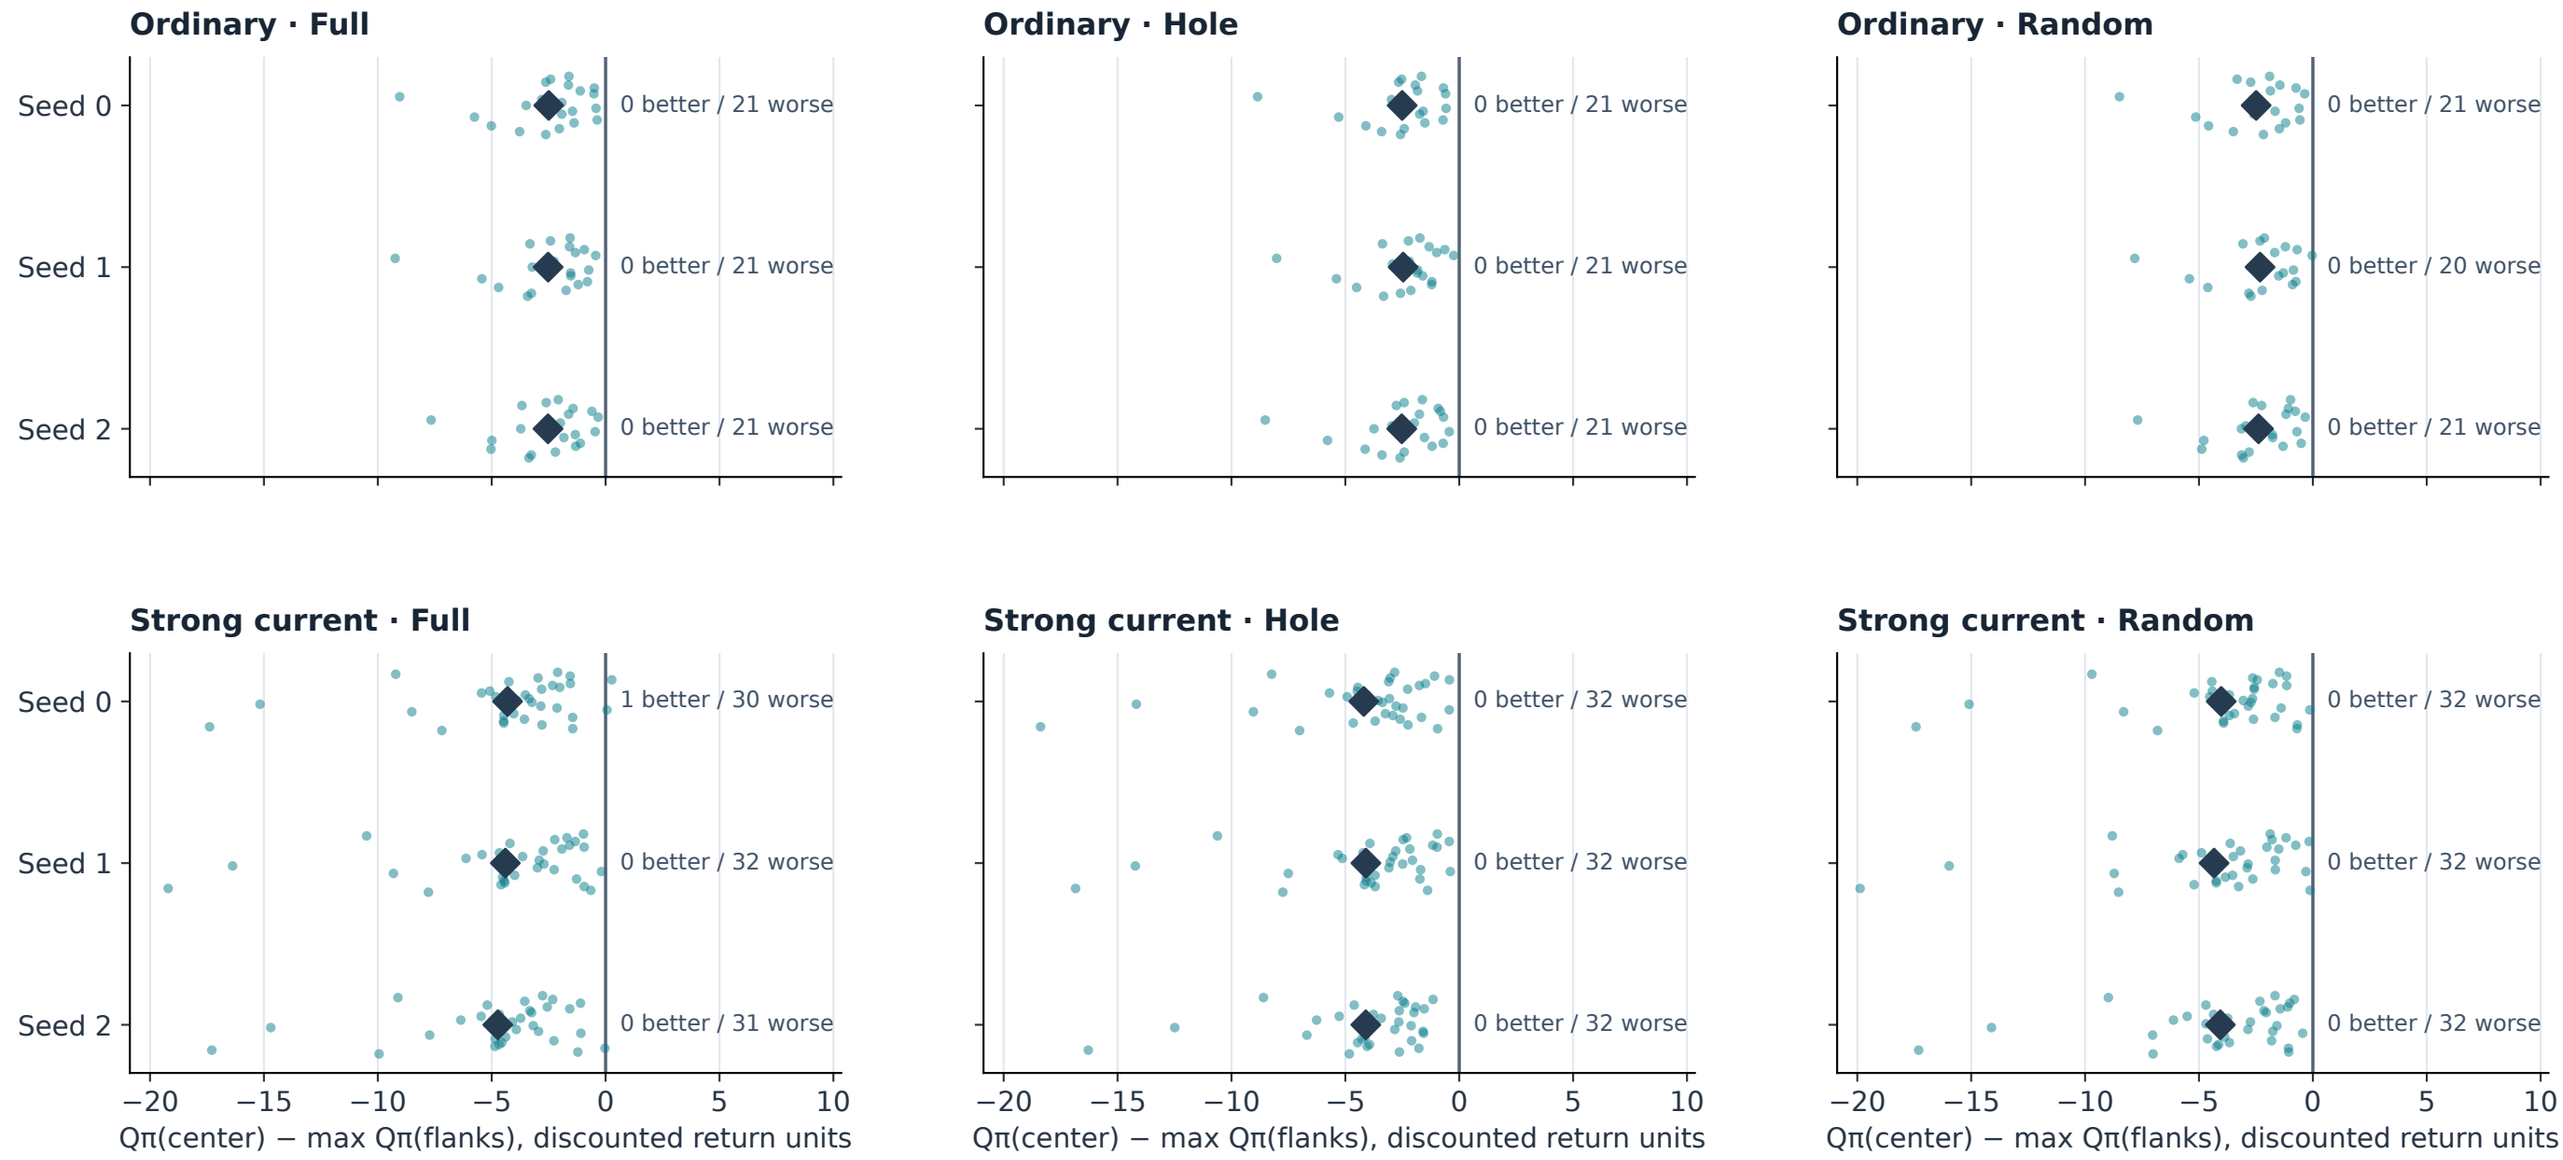
Is the center action better than either retained flank?

BCA-trained final policies · high-load forced-action anchors · each point is a state family



● State family ◆ Mean across state families

Center: $a_0 = 0$; flanks: $a_0 = -0.5$ or $+0.5$; remaining action coordinates are zero. Each value follows the same checkpoint's actor.

Positive means center is better. Better / worse counts use a ±0.1 tolerance; the remaining states are near tied.

Source: authenticated rerun · 21 ordinary and 32 strong-current high-load anchors per seed · no claim about global optimal actions
