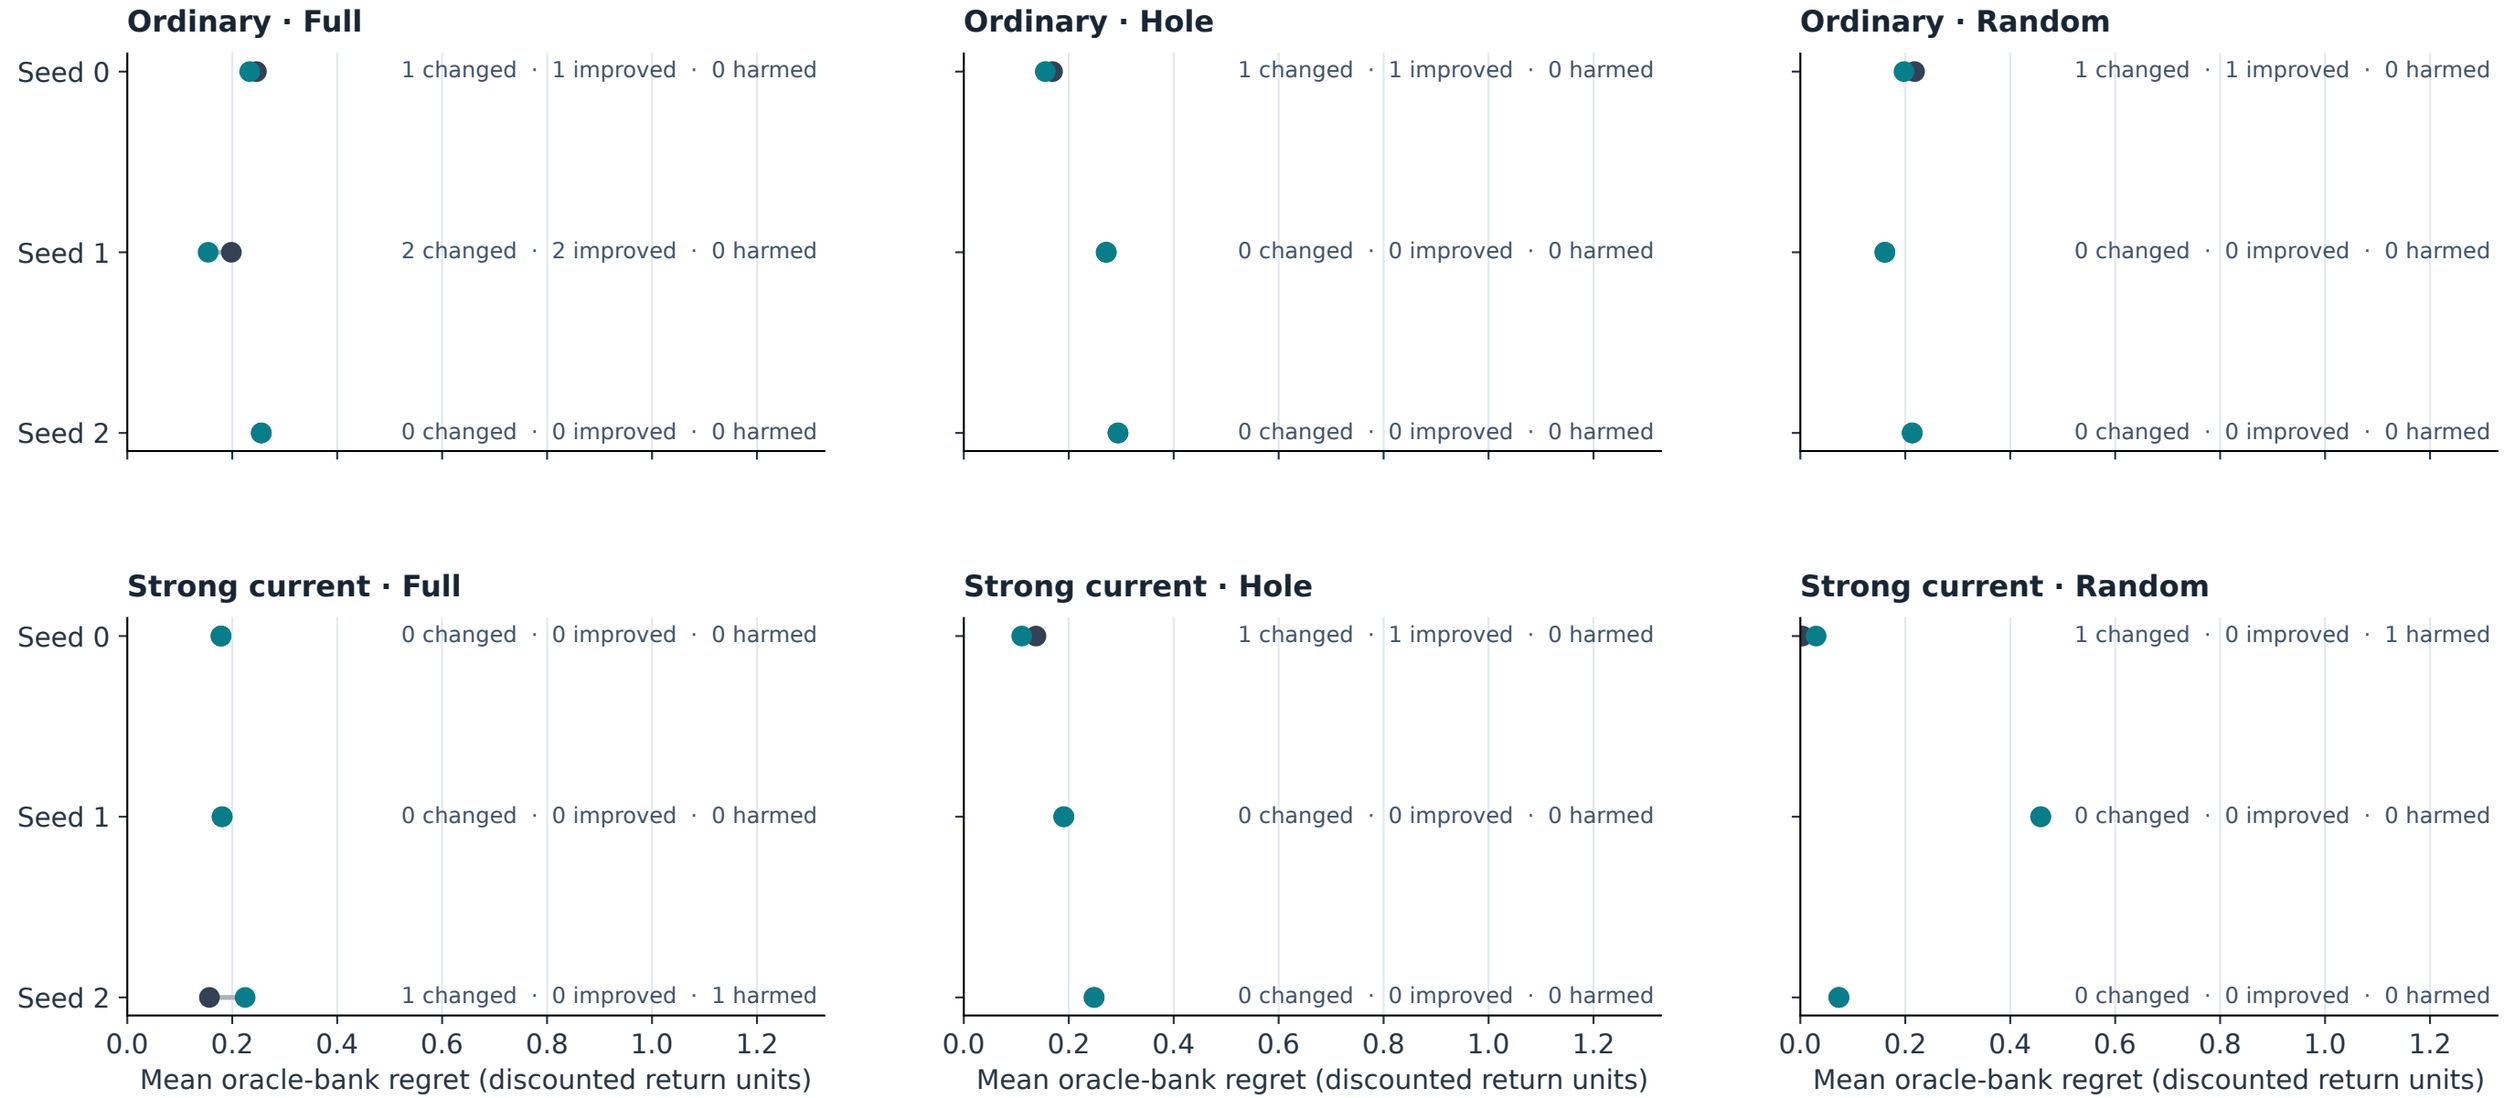
Does the pessimistic score change forced-action decisions?

BCA-trained policy at 20k updates · 32 shared anchor states per context and seed



One forced action from a six-action bank, then that checkpoint’s own actor. Regret is relative to the best action in this bank only.

Improved / harmed: change in true bank-choice Qπ greater than +0.1 / less than −0.1. Changed choices with near-tied value are not counted as either.
