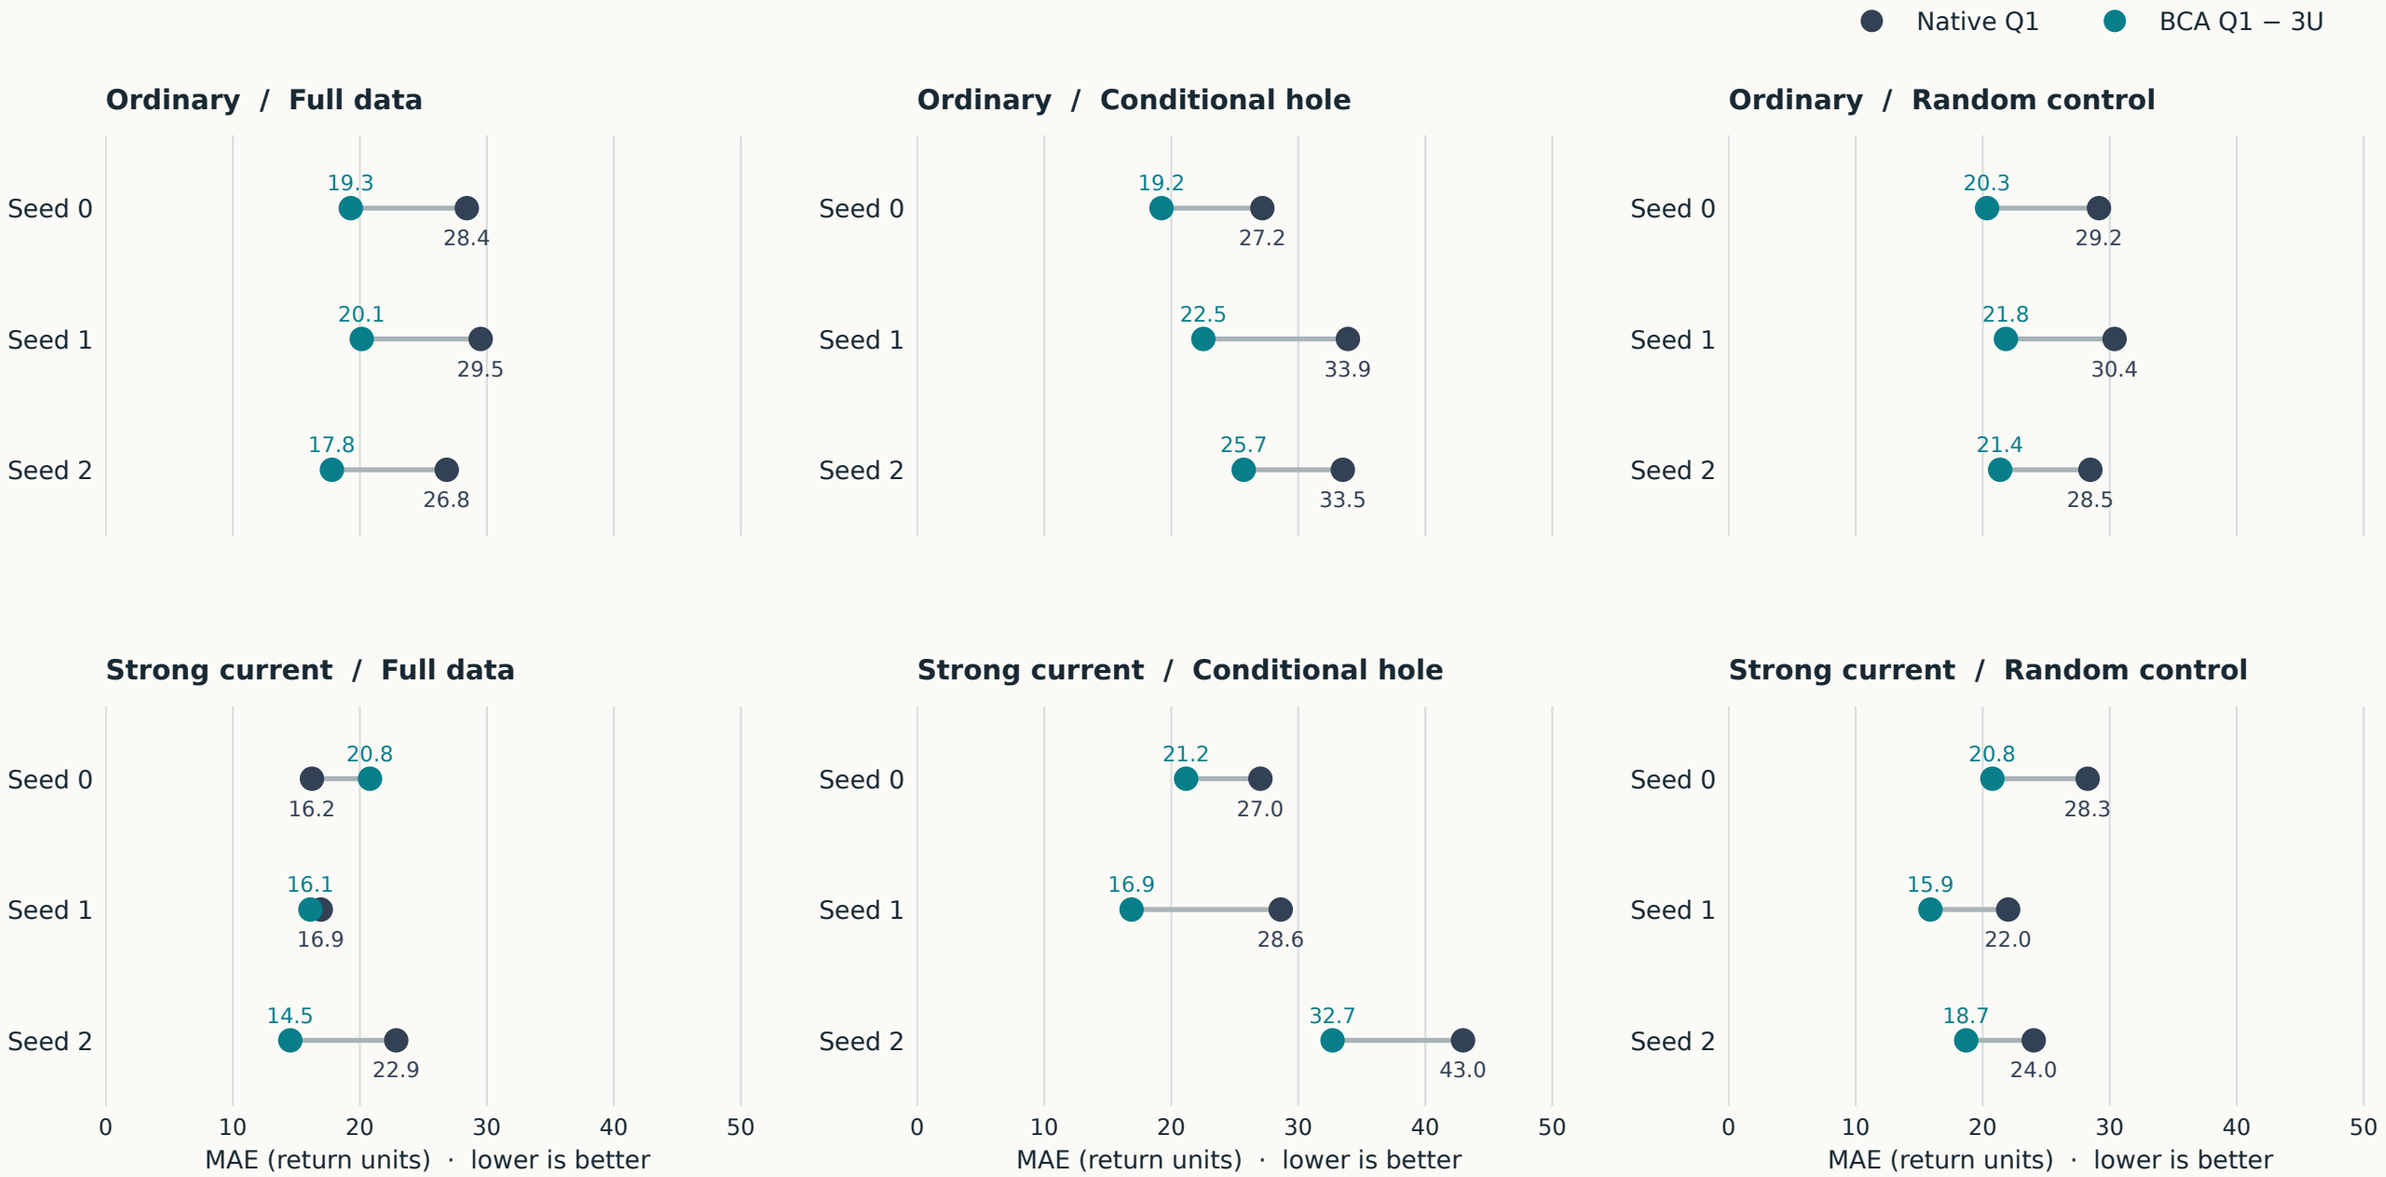
Q accuracy: BCA scores versus native Q1

High-load anchors, fixed actions inside the withheld band | Final checkpoint | One line per training seed



Each model is compared with its own policy continuation: these are different Qπ references. Ordinary hole is the prespecified accuracy screen.
21 ordinary / 32 strong-current anchor families per seed; three fixed actions per anchor are correlated. Three independent training seeds, one dataset and mask.
MAE = mean absolute error in discounted-return units; U = BCA uncertainty score. Source: authenticated report 55cae667d369.
