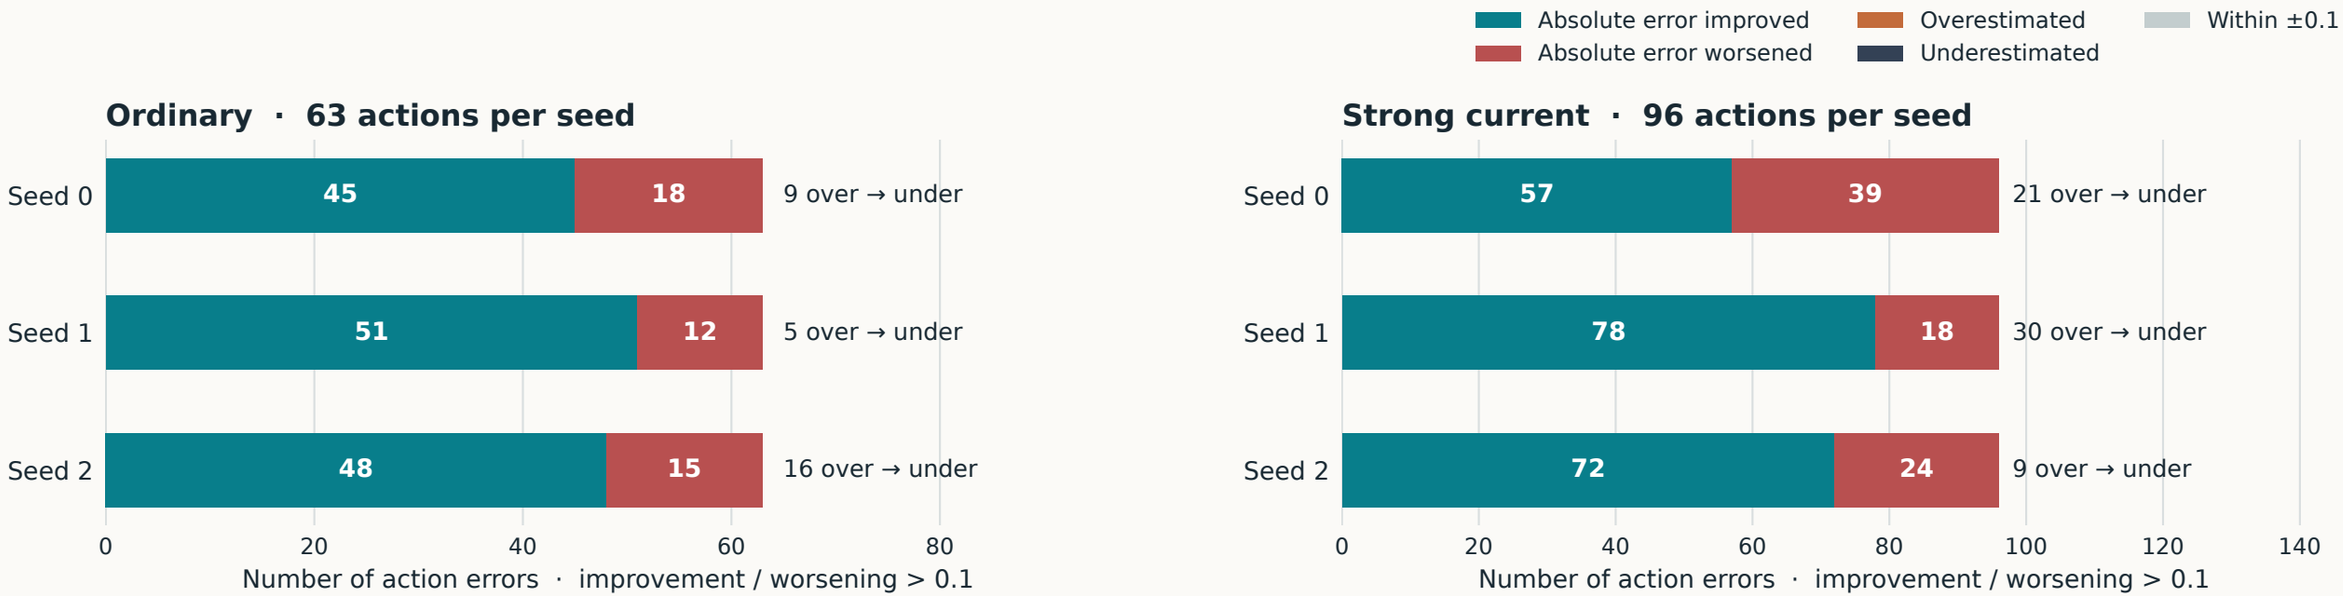
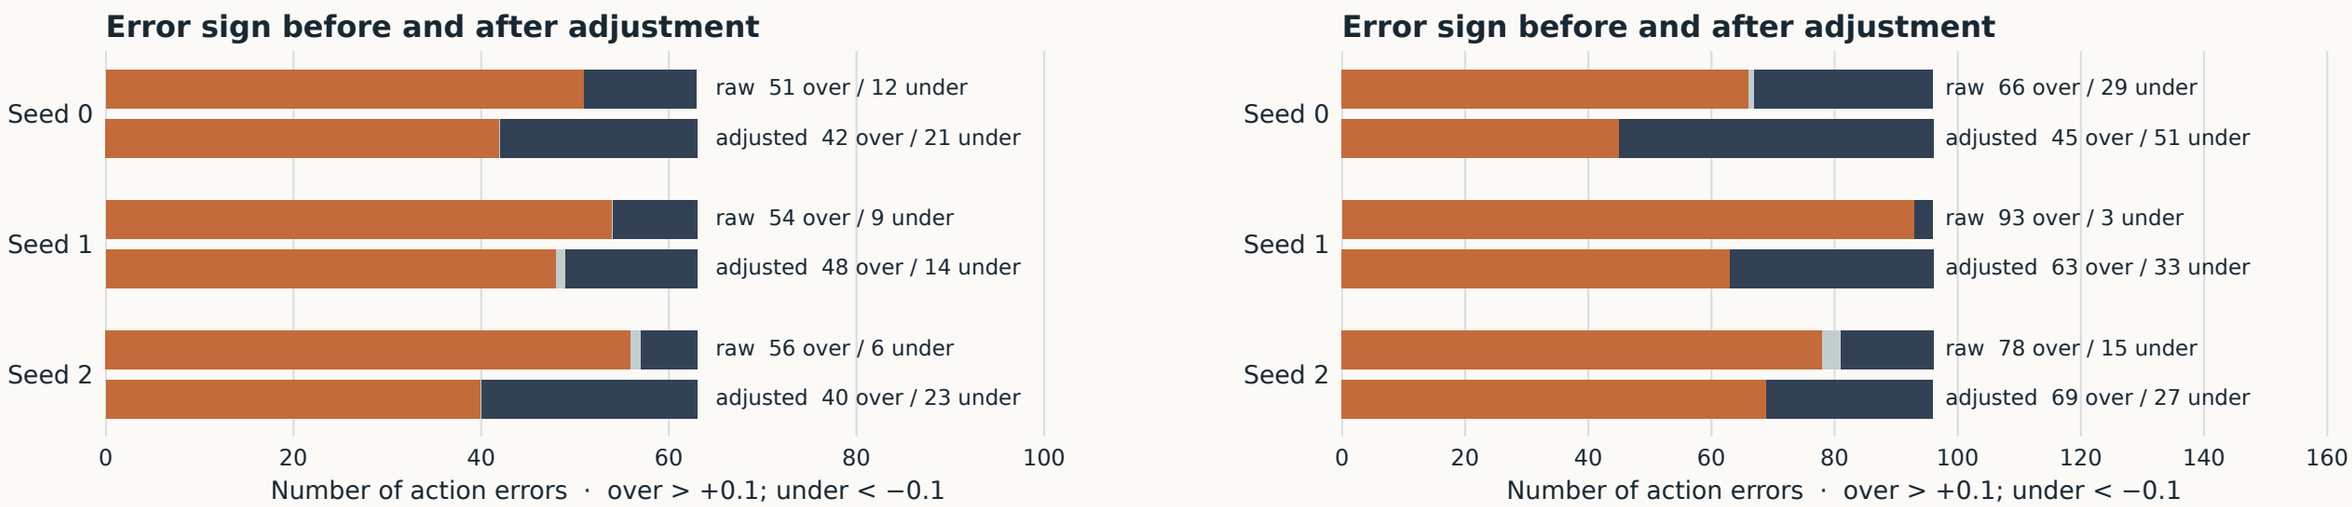
Pessimism helps many scores — and harms others

BCA-trained critics in the conditional-hole condition | High-load fixed-band forced actions | Final checkpoint





Signed error = score − own-policy Qπ; the same BCA-trained policy is used before and after adjustment. A sign crossing is not necessarily a worsening.
Ordinary: 21 anchor families × 3 actions; strong current: 32 × 3. Correlated action counts are descriptive, not independent seed replicates.
