Which local action gradients point into the hole band?

Final 20k checkpoint · high-load logged probes whose actor action is outside $|a_0| \le 0.25$

Each dot uses the high-load, outside-band subset of 768 retained logged probes (200–232 rows here).
Inward means the negative first-action loss gradient points toward the band; it is not an executed actor movement.
Native penalty is zero and omitted in the bottom row. The mask is a construction label, not proof of local or joint support.
